**TO WHOM IT MAY CONCERN**

We herewith confirm that MERO - Raumstruktur GmbH & Co., Wurzburg, Germany have designed, manufactured and installed two full aircraft maintenance docking systems, one for the aircraft type MD-80 and one for the B737 in the year 1992. Both dock installations cater for all aircraft sub types and are equipped with distribution networks for electricity and compressed air as well as with ductwork for fuel tank ventilation. Two further tail docks of the same basic design, with just some modifications for the particular use, were supplied for our aircraft painting hangar.

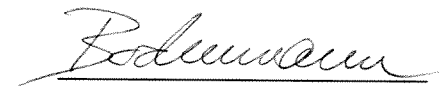

MERO with the overall responsibility did (as requested by Shannon Aerospace) subcontract parts of the steel work fabrication, the assembly work and the services installation to local companies.

We can now confirm that MERO have completed the entire project in the given tight time frame and that the quality of the design and workmanship met the requested high standards.

We have no hesitation in recommending MERO as a main contractor for similar aircraft docking systems including the installation of electrical and mechanical services.
